In BibleWorks, the Analysis Window displays parsing information and lexicon entries for Greek and Hebrew words. (The Analysis Window is the far-right window, the third window of the three main windows in BibleWorks.) While this information is helpful, there are times where it would be useful to hide information for frequently-occurring words in order to encourage vocabulary learning. The Analysis Window Frequency Filter enables you to turn off display of information for frequently-occurring words.

**Uses for the Frequency Filter**

The Analysis Window Frequency Filter was designed at the request of professors teaching Greek and Hebrew. By enabling the Frequency Filter and setting the display cutoff point, users can use the Analysis Window to display lexicon information for infrequently-occurring words, while hiding lexicon information for frequently-occurring words. Professors can instruct students who are using BibleWorks to turn on the Frequency Filter while studying Greek or Hebrew.

A BibleWorks user may decide to enable the Frequency Filter in order to gain proficiency in Greek or Hebrew vocabulary during regular study in the Greek and Hebrew texts.

**Enabling the Frequency Filter**

Enabling the Frequency Filter is easy. Right-click inside the Analysis Window to display the context menu, and then select Enable Frequency Filter for Greek and Hebrew. If you wish to turn off the Frequency Filter, select this context menu option to uncheck it.

**Setting the Cutoff Setting for the Frequency Filter**

The Frequency Filter cutoff settings are set by selecting **Tools | Options** from the BibleWorks main menu, then selecting **General | Option Strings**. At the bottom left of the window are the Analysis Window Frequency Cutoff settings.
Enter the desired cutoff numbers in the Greek and Hebrew boxes. The default number, 1000000, means that every word will display in the Analysis Window. If you want to display only the words that appear 50 or fewer times, enter 51 in the number box, then enable the Frequency Filter. The vocabulary frequencies come from the Vocabulary Flashcard glosses files. The versions used for these files are GNM and WTM lemmas. If you use a version other than the GNM/GNT (and probably the BNM/BNT) and the WTM/WTT, the frequency numbers may not be correct for your version.

Disabling Tool Tips

While the above process will limit what parsing/lexical information is displayed in the Analysis Window, it will not eliminate the information provided in the “Word tips” that pop up when you hover your mouse over a word in the Browse Window. To disable the word tips, select Tools | Options from the BibleWorks main menu, then General | Flags.

Next, toggle the Browse Window Configuration Options and uncheck “Show word tips” and click “OK”.

Now when you hover your mouse pointer over a word in the Browse Window you will no longer see the word tips giving ‘glosses’ (short definitions) for each word, and if you’ve followed the directions above, you will only see information for words used under a certain frequency in the Analysis Window.

No more crutch!
